

Relational Data Model

Christopher Simpkins

Relational Data Model

A **relation schema** $R(A_1, \dots, A_n)$ is a relation name R and a list of attributes A_1, \dots, A_n .

Each attribute A_i is the name of a role played by some domain D .

- ▶ Example: $AUTHOR(author_id, first_name, last_name)$
 - ▶ $dom(A_1)$ (or $dom(author_id)$) is integer

A **database schema** is a collection of relation schemas.

- ▶ Example: $PUBS$ database has relation schemas $BOOK$, $AUTHOR$, and PUB (for publication, not public house)

Relations and Databases

A **relation**, or **relation state**, $r(R)$ is a **set** of tuples that conform to a **relation schema** R .

- ▶ Example: $r(AUTHOR) =$

author__id	first__name	last__name
1	John	McCarthy
4	Claude	Shannon
5	Alan	Turing
6	Alonzo	Church

A **database** is a set of relations.

Tuples

A **tuple** is an **ordered list** of values that is part of a relation

- ▶ Example: $t_1 = \langle 1, 'John', 'McCarthy' \rangle$

Each value in the tuple is that tuple's value for the corresponding attribute of the relation schema.

Example: (these are equivalent notations):

- ▶ $t_1[first_name] = 'John'$ (bracket notation)
- ▶ $t_1.first_name = 'John'$ (object notation)
- ▶ $t_1[2] = 'John'$ (positional notation)

The **degree** or **arity** of a relation schema is the number of attributes it has.

- ▶ Example: *AUTHOR* has degree 3.

An Example Relation

Diagram illustrating the structure of a relation **STUDENT**.

The relation is defined by its **Relation Name** (**STUDENT**) and its **Attributes** (Name, Ssn, Home_phone, Address, Office_phone, Age, Gpa).

The relation contains the following **Tuples** (rows):

Name	Ssn	Home_phone	Address	Office_phone	Age	Gpa
Benjamin Bayer	305-61-2435	373-1616	2918 Bluebonnet Lane	NULL	19	3.21
Chung-cha Kim	381-62-1245	375-4409	125 Kirby Road	NULL	18	2.89
Dick Davidson	422-11-2320	NULL	3452 Elgin Road	749-1253	25	3.53
Rohan Panchal	489-22-1100	376-9821	265 Lark Lane	749-6492	28	3.93
Barbara Benson	533-69-1238	839-8461	7384 Fontana Lane	NULL	19	3.25

Figure 5.1

The attributes and tuples of a relation STUDENT.

Attributes and Domains

Each attribute has a name and a **domain**

- ▶ The name describes the role played by the attribute
 - ▶ Example: the *first_name* attribute of the *AUTHOR* schema plays the role of the first name of an author represented by a tuple in a $r(AUTHOR)$ relation.
- ▶ The domain is a set of atomic values that a tuple may have for that attribute.
- ▶ A **logical definition** of a domain specifies a simple type such as integer or string, and a **data type** or **format**
 - ▶ Example: USA_phone_number as $(ddd)ddd - dddd$, where d is a digit

Mathematical Definition of Relation

Given $R(A_1, \dots, A_n)$,

$$\blacktriangleright r(R) \subseteq (dom(A_1) \times dom(A_2) \times \dots \times dom(A_n))$$

The total number of values, or **cardinality**, of a domain D is $|D|$.

So the maximum number of tuples that could possibly be in $r(R)$ is

$$\blacktriangleright |dom(A_1)| * |dom(A_2)| * \dots * |dom(A_n)|$$

Properties of Relations

- ▶ Atomicity of values, i.e., the First Normal Form assumption
 - ▶ Attribute values in tuples are indivisible, e.g., no compound or multivalued attributes as in EER models
- ▶ Nulls
 - ▶ Unknown, not applicable, not existing
- ▶ Closed world assumption
 - ▶ Facts not asserted explicitly are assumed to be false

Kinds of Constraints

- ▶ Inherent model-based (or **implicit**) constraints
 - ▶ domain constraints, atomic attribute values
- ▶ Schema-based (or **explicit**) constraints
 - ▶ keys, referential integrity
- ▶ Application-based (or semantic constraints), a.k.a., business rules

Superkeys

A **superkey** SK is a set of attributes of a relation schema R such that

$$t_i[SK] \neq t_j[SK]$$

for any $i \neq j$.

In other words, the values of the superkey attributes of a tuple uniquely identify the tuple within the relation.

By the definition of the relational model, the full attribute set of a relation schema is a **default superkey**.

Keys

A **minimal superkey** is a superkey for which removing an attribute would make it no longer a superkey.

We call a minimal superkey a **key**.

A relation schema may have several keys. We call these **candidate keys** and choose one arbitrarily to be the **primary key**.

We underline the primary key in a relation schema.

- ▶ Example: *AUTHOR*(*author__id*, *first__name*, *last__name*)

Database Integrity Constraints

- ▶ Domain constraints - Attribute values in tuples must be in domain for that attribute
- ▶ Key constraints - No two tuples can have the same values for the primary key
- ▶ Entity Integrity Constraints - No tuple can have a NULL value for its primary key attribute
- ▶ Referential Integrity Constraints - Tuples in one relation referencing tuples in another relation
- ▶ Semantic Integrity Constraints - Constraints on values of attributes that cannot be specified in the databases DDL

Referential Integrity Constraints

A foreign key value from a tuple in one relation must refer to nothing, or to the primary key for an existing tuple in another relation. Formally:

Given relation schemas R_1 and R_2 , a set of attributes FK in R_1 is a foreign key referencing R_2 if

- ▶ the attributes in FK in R_1 have same domains as PK in R_2
- ▶ Given some t_1 in $r_1(R_1)$ and t_2 in $r_2(R_2)$, either $t_1[FK] = t_2[PK]$ or $t_1[FK]$ is NULL.

R_1 is the referencing relation, R_2 is the referenced relation.

Diagramming FK Relationships

EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary	Super_ssn	Dno
-------	-------	-------	------------	-------	---------	-----	--------	-----------	-----

DEPARTMENT

Dname	<u>Dnumber</u>	Mgr_ssn	Mgr_start_date
-------	----------------	---------	----------------

DEPT_LOCATIONS

<u>Dnumber</u>	<u>Dlocation</u>
----------------	------------------

PROJECT

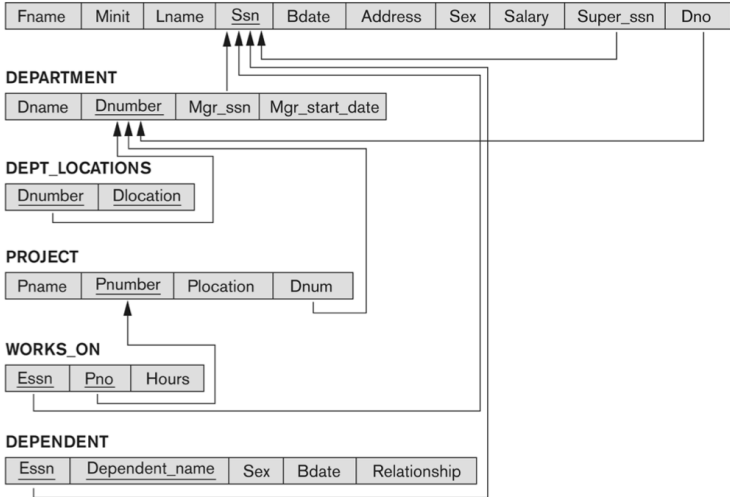

Pname	<u>Pnumber</u>	Plocation	Dnum
-------	----------------	-----------	------

WORKS_ON

<u>Essn</u>	<u>Pno</u>	Hours
-------------	------------	-------

DEPENDENT

<u>Essn</u>	<u>Dependent_name</u>	Sex	Bdate	Relationship
-------------	-----------------------	-----	-------	--------------

Semantic Integrity Constraints

- ▶ Can't be specified in DDL
- ▶ Can be checked with triggers and assertions
- ▶ Usually checked in application code

Example: salary of an employee cannot exceed the salary of the employee's supervisor.

Constraint Violations on Insert

- ▶ Domain constraints
 - ▶ Insert a tuple with an attribute value not in attribute's domain
- ▶ Key constraints
 - ▶ Insert a tuple with a key that's already in the relation state
- ▶ Entity integrity constraints
 - ▶ Insert a tuple with a NULL value for any part of the primary key
- ▶ Referential integrity constraints
 - ▶ Insert a tuple in a referring relation whose FK does not appear as a PK value in any tuple of the referenced relation

Constraint Violations on Update

- ▶ Domain constraints
 - ▶ Update a tuple with an attribute value not in attribute's domain
- ▶ Key constraints
 - ▶ Update a tuple with a key value that already appears in another tuple in the relation
- ▶ Entity integrity constraints
 - ▶ Update a tuple with a NULL value for any part of the primary key
- ▶ Referential integrity constraints
 - ▶ Update a tuple in a referring relation with a FK does not appear as a PK value in any tuple of the referenced relation
 - ▶ Update the primary key for a tuple in a referenced relation for which there are tuples in referring relationships. The tuples in referring relationships would be orphaned or end up referring to the wrong parent

Constraint Violations on Delete

- ▶ Referential integrity
 - ▶ Delete a tuple in a referenced relationship for which there are tuples in referring relationships. The tuples in referring relationships would be orphaned.

Domain Integrity Violation Examples

author_id	first_name	last_name
1	John	McCarthy
4	Claude	Shannon
5	Alan	Turing
6	Alonzo	Church

$dom(author_id) = integer$, $dom(first_name) = string$, $dom(last_name) = string$

- ▶ Insert $\langle "Two", "Jenny", "McCarthy" \rangle$ – "Two" is not in $dom(author_id)$
- ▶ Update $\langle 1, "John", "McCarthy" \rangle$ to $\langle 1, "John", 1 \rangle$ – 1 is not in $dom(last_name)$

Key Integrity Violation Examples

<u>_author_id_</u>	<u>first_name</u>	<u>last_name</u>
1	John	McCarthy
4	Claude	Shannon
5	Alan	Turing
6	Alonzo	Church

- ▶ Insert $\langle 1, "Jenny", "McCarthy" \rangle$ – 1 is an existing primary key
- ▶ Update $\langle 6, "John", "McCarthy" \rangle$ to $\langle 1, "John", 1 \rangle$ – 6 is an existing primary key

Entity Integrity Violation Examples

<u>_author_id_</u>	first_name	last_name
1	John	McCarthy
4	Claude	Shannon
5	Alan	Turing
6	Alonzo	Church

- ▶ Insert $\langle \text{NULL}, "Jenny", "McCarthy" \rangle$ – *NULL* not allowed for primary key
- ▶ Update $\langle \text{NULL}, "John", "McCarthy" \rangle$ to $\langle 1, "John", 1 \rangle$ – *NULL* not allowed for primary key

Referential Integrity Violations – Employee - Department Example
